(54) Sports field with natural grass and artificial grass and a method for laying same.

(57) A sports field comprises a foundation which bears an artificial grass surface and which is rooted with roots of grass plants passing through the artificial grass surface.

EP 0 403 008 A1

SPORTS FIELD WITH NATURAL GRASS AND ARTIFICIAL GRASS AND A METHOD FOR LAYING SAME

The present invention relates to a sports field whereof the top layer consists only partially of artificial grass and consists partially of natural grass. This sports field is suitable for all kinds of field sports such as football, hockey, tennis and the like.

The use of sports fields with a top layer of artificial grass is becoming increasingly common because of the reduced maintenance and the more intensive use compared to a sports field of natural grass.

A drawback of the use of artificial grass is that when there is frictional contact of the skin with the artificial grass, for instance in the case of a sliding tackle or unintended fall, the frictional resistance is so high that this contact is experienced as unpleasant and can cause wounds and injuries. Efforts have been made to lower the frictional resistance by changing the fibre structure of the artificial grass (frizzed fibres) or by applying a lubricant to the fibres.

The present invention has for its object to avoid as far as possible the above mentioned drawbacks of an artificial grass field, wherein the advantages of the artificial grass field remain preserved and in addition the properties of the sports field according to the invention correspond more closely to those of a sports field with a grass surface.

This is achieved according to the invention in that the sports field comprises a foundation which bears an artificial grass and which is rooted with roots of grass plants passing through the artificial grass surface. The sports field according to the invention therefore consists of a grass surface of artificial grass and natural grass, wherein the latter is preferably slightly longer by setting a specific mowing height, whereby the natural grass lies partially over the artificial grass, wherein however the artificial grass provides the natural grass with firmness and protection. This means that compared to a purely artificial grass the foundation usually has a simpler construction and requires a smaller investment. It is also once again possible to suffice with the usual chalk markings.

The artificial grass for use according to the invention is provided over its surface with openings through which the grass plants grow from the foundation.

Such an artificial grass can be manufactured in simple manner if the artificial grass is provided with a tuft cloth or canvas and the openings are either formed from yarn threads and/or weft threads missing in the tuft cloth or canvas or are punched in. Because of the openings now present in the tuft

cloth no latex layer can be formed on the underside of the artificial turf at the location of these openings, so that it is scarcely or not necessary to adapt the normal manufacturing process of the artificial grass. In order to avoid the tuft cloth and ultimately the turf losing strength at the position of the openings through the omission of yarn threads and/or weft threads, it is recommended that yarn threads and/or weft threads adjoining the openings have a greater diameter than other tuft cloth threads. An optimal artificial grass according to the invention is provided on 30-60% of its surface with openings for grass plants.

Specific requirements are set down for the foundation of the sports field because the foundation must on the one hand provide the artificial grass with stability and must on the other hand provide the grass plants with a biological environment favourable to growth. It has been found however that as a consequence of the rooting of the grass plants in the foundation, the foundation can possess in its simplest embodiment an individual stability that is smaller than that for a foundation whereon only artificial grass is laid. The foundation preferably comprises a mixture of sand and particle-form material with hooking resistance, which mixture contains 2-8% by weight of humus material. The particle-form, hooking material forms a skeleton providing the stability over the height of the foundation, wherein the sand and the humus material fill the hollow spaces and form there an environment for the grass plant roots. An optimum foundation mixture comprises sand and particle-form material in a weight ratio of 60-30 to 40-70. As particle-form material can be used lava and steagranTM.

For specific applications, such as football, it may be desired to provide the sports field with a greater damping power. For this purpose damping, particle-form material can be added to the mixture in a quantity of 15-60% by weight. This damping material preferably consists of rubber particles such as rubber fibres and rubber nuggets.

In a particular embodiment the sand consists of low-grade earth with a humus content of 2-8% by weight.

In order to allow development of the grass plants grass seed has to be caused to germinate in one way or another. According to a first embodiment the foundation can be sown with grass seed which only germinates and eventually grows at the location of the openings in the grass covering. Another embodiment comprises the sowing of the artificial grass, wherein only the grass plants in the immediate vicinity of the openings in the grass

made of chalk lines which adhere to the natural grass shoots. Line-marking using inset line tracks remains possible, which inset tracks can optionally have grass plants growing therethrough.

Claims

1. Sports field comprising a foundation which bears an artificial grass surface and which is rooted with roots of grass plants passing through the artificial grass surface.
2. Sports field as claimed in claim 1, wherein openings for the grass plants are present in the artificial grass.
3. Sports field as claimed in claim 2, wherein the artificial grass is provided with a tuft cloth and the openings are formed from yarn threads and/or weft threads missing in the tuft cloth.
4. Sports field as claimed in claim 3, wherein yarn threads and/or weft threads adjoining the openings have a greater diameter than other tuft cloth threads.
5. Sports field as claimed in claims 1-4, wherein 30-60% of the surface of the artificial grass consists of openings for the grass plants.
6. Sports field as claimed in claims 1-5, wherein the artificial grass consists of straight and/or frizzed fibres with a fibre length of 15-35 mm.
7. Sports field as claimed in claims 1-6, wherein the foundation comprises sand with a humus content of 2-8% by weight.
8. Sports field as claimed in claim 7, wherein the foundation comprises a mixture of sand and particle-form material with hooking resistance, which mixture contains 2-8% by weight of humus material.
9. Sports field as claimed in claim 8, wherein the foundation mixture contains sand and particle-form material in a weight ratio of 60-30 to 40-70.
10. Sports field as claimed in claim 9, wherein the particle-form material comprises lava and steagran™.
11. Sports field as claimed in claims 8-10, wherein damping, particle-form material is added to the mixture in a quantity of 15-60% by weight.
12. Sports field as claimed in claim 11, wherein the damping material consists of rubber particles.
13. Sports field as claimed in claims 9-12, wherein the sand consists of low-grade earth with a humus content of 2-8% by weight.
14. Sports field as claimed in claims 1-13, wherein between the artificial grass and the foundation is arranged a germinating bed layer for grass seed.
15. Method for laying a sports field as claimed in claims 1-13, comprising the steps of:

5 i) arranging the foundation on a ground;
 ii) arranging a layer containing grass seed on the foundation;
 iii) laying out the artificial grass over the
 grass seed layer;
 iv) allowing the grass seed to germinate;
 v) strewing sand into the artificial grass; and
 vi) mowing the grass plants to a length that
 is greater than the length of the artificial grass
 fibres.

10 16. Method as claimed in claim 15, wherein in
 step ii) grass seed is sown on the foundation in a
 quantity of 100-600 kg per hectare.

15 17. Method as claimed in claim 15, wherein in
 step ii) a germinating layer containing grass seed
 is laid out on the foundation.

20 18. Method for laying a sports field as claimed
 in claims 1-14, comprising the steps of:

25 i) arranging the foundation on an underlayer;
 ii) laying out the artificial grass on the foun-
 dation;
 iii) sowing grass seed in the artificial grass;
 iv) strewing sand at least partially into the
 artificial grass; and

30 v) mowing the grass plants to a length that is
 greater than the length of the artificial grass fibres.

35 19. Method as claimed in claims 15-18 wherein
 the artificial grass is strewn with sand that contains
 1-2% of humus material.
